Smartphone Vs. Plane

In the 1970's it was hard to keep track of where kids or parents were which is why the rule of be home before the streetlights came on had become a dominant phrase. However in 1992 IBM, a company devoted to making useful technology for communities worldwide, released the first smart phone. Now, in 2015 I can be contacted instantaneously without having to come home when the streetlights come on 365 days of the year, 7 days of the week, and 24 hours of the day. Now there are many influential inventions, however the smartphone is the MOST influential invention of all time. Here's a few reasons why.

Disregarding the fact that 1 in every 5 people worldwide own one today.

The smartphone has also been used and compared to a computer being able to upload and download any content without missing a beat to having data usage when you need it for those projects you never did on time or shopping online Smartphone has got it all. Its helped save thousands of dollars this way by not having to purchase more than one electronic for a specific purpose just because it can do more than one task at once.

Another important reason is the GPS system wired into the smartphone. Not all of us have a convenience of using a map i know i don't. Copious amounts of people would be lost or unable to be found without the Gps system which helps to keep track of where you are, as well as assist you into finding the places you want to go without having to waste any time or money.

Lastly, Smartphones has sparked a world of rapid change in technology. It has helped to make software better, stronger, and faster to compete with the high demand s and usages of the smartphone. Which is what makes the smartphone influential. It has dominated the phone industry and is used by millions of people today, don't believe look around. I'm Aziza Crowder And the smartphone IS the most influential invention of our time.
